

How to Update Target IPs

In order for WEDOS.protection to function correctly, the Target IPs for each domain must be set to the correct origin/web server IPs for the domain. If these are not configured correctly during setup, or the web server is moved or has a new IP address, then you must update the Target IPs in WGP to avoid downtime.

To update Target IPs in WGP:

1. Log in to WGP at <https://client.wedos.global>.
2. In the **Domain** detail, navigate to **Target IPs**.

3. Click **Add IP** and enter the new IPv4 and IPv6 addresses.
 - a. **Please note:** Your web service might only use IPv4.
4. Deactivate old Target IPs and activate new Target IPs.
 - a. **Please note:** Changes to Target IPs take effect immediately, so do not activate the new Target IPs until the web server configuration is complete.
